Problem Set 2

Instructions: Write up your solutions using LaTeX and submit them on HuskyCT by September 25, 2022.

Problem 1: Let $n \geq 2$. The group S_n is defined via its "natural" action on the set $[n] = \{1, 2, ..., n\}$. From this action, and given $1 \le k \le n$, we can deduce an action of S_n on the set $P_n(k)$ of k-element subsets of [n] by defining $\sigma(\{a_1,\ldots,a_k\})=\{\sigma(a_1),\ldots,\sigma(a_k)\}$. Since there are $\binom{n}{k}$ elements of P(k) this action yields a homomorphism $\phi_{n,k}: S_n \to S_{\binom{n}{k}}$.

- 1. Let n = 4. Describe the maps $\phi_{4,1}$, $\phi_{4,2}$, and $\phi_{4,3}$.
- When is φ_{n,k} faithful? In other words, when is φ_{n,k} injective?
 Notice that (ⁿ_{n-1}) = n so φ_{n,n-1} is a homomorphism from S_n to itself. Describe this map. Is it always an isomorphism?
